EXAMINER

KLIMACH, PAULA W

ART UNIT	PAPER NUMBER
----------	--------------

2135

DATE MAILED: 05/06/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 09/838,759	Applicant(s) RUSSELL ET AL.	
	Examiner Paula W. Klimach	Art Unit 2135	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
 - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
 - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
 - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 January 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-4, 8-9, 15 and 16 is/are rejected.
- 7) ☐ Claim(s) 5-7 and 10-14 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

This office action is in response to amendment filed on 01/10/05. The amendment filed on 01/10/05 have been entered and made of record. Therefore, presently pending claims are 1-16.

Response to Arguments

Applicant's arguments filed 01/10/05 have been fully considered.

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, combining Moskowitz and Moore would increase security by sharing the secret. Encrypting the block list as in Brundrett in the system of Moore would also increase security using encryption to mask the list of files that have been encrypted.

Applicant argued that Moskowitz is not shown to suggest generating an encryption key at the metadata server and at the storage server and storing the key in the security object. This is not found persuasive. Moskowitz discloses, as disclosed by the applicant, breaking the keys into partial keys that is the process of generating the encryption keys. Each of the partial keys is used to perform the final encryption therefore each partial key is an encryption key.

The applicant argued further, that Brundrett is not shown to suggest the limitations of and related to storing the key in the security object, encrypting a list that identifies a set of blocks in the opened file, and adding the encrypted list to the security object. Brundrett discloses the key being extracted from the meta data, it can therefore be inferred that the key was stored (inserted) in the meta data (column 6 lines 15-20). In reference to encrypting a list that identifies a set of blocks in the opened file, blocks are a segment of text that can be selected and acted upon as a whole in an application. Since a file is a block of text that can be selected and acted upon as a whole in an application, then the directory is the list that identifies a set of blocks (column 5 lines 10-15). Further in reference to adding the encrypted list to the security object. The Brundrett reference refers to encrypting the file and the directory; therefore the encrypted list is added to the security object.

The applicant adds further that there is no teaching suggesting the transmitting of the claimed security object to a distributed file system interface. This is not persuasive. The examiner would like to bring the applicants attention to Fig. 7 of Moore wherein the client performs a write function to an object that is maintained in the server. The only way in which the data, written in the client, can be maintained at the server is when it is transmitted to the server.

In reference to claim 2, the applicant argues further that there is no apparent correspondence of transmitting a file access request and the claimed security object from the distributed file system interface to the storage server. The examiner would like to direct attention to Fig. 7 of Moore.

In reference to claim 15, the applicant argues that Brundrett suggests decrypting file data, not decrypting a block list. This is not persuasive because of the definition of block, taken

Art Unit: 2135

above, and therefore a block list is a directory and Brundrett does disclose the decryption of the directory (column 18 lines 30-32).

In reference to claims 5-7 and 10-12, the applicant argues that there is no apparent transmission of any security object minus a block list as claim. This is found persuasive and the rejection is therefore withdrawn.

The examiner asserts that Moore, Brundrett, and Moskowitz do teach or suggest the subject matter broadly recited in independent Claims 1 and 13-14. Dependent Claims 2-4 and 8-9 are also rejected at least by virtue of their dependency on independent claims and by other reason set forth in this office action. Accordingly, rejections for claims 1-4, 8-9, and 15-16 are respectfully maintained.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-4, 8-9, and 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Moore (6,678,700) in view of Moskowitz (20020071556 A1) and Brundrett et al. (6,249,866).

In reference to claims 1 and 13-14, Moore et al (6,678,700) discloses a method of receiving at the meta-data server an open-file request that is created by the application

Art Unit: 2135

(distributed file interface coupled to the client; column 6 lines 36-45), the open-file request specifying a name of a first file, wherein the first file includes a first set of blocks (column 6 lines 13-45 in combination with column 18 lines 23-28). The request for the resource would include the name of the file (Fig. 7 part 40). During the creation of the Meta data creation of normal objects is used to put data objects into a container at the SRB server (meta data server) (column 18 lines 37-46), thus creating an object in response to the open-file request. Moore discloses writing the data to the copy then updating the container. This is the function of transmitting the object to the file interface because the client and the server have the same copy of the information on the file interface.

However Moore does not disclose generating an encryption key at the meta-data server and the storage server.

Moskowitz et al teaches the generation of partial keys at different entities (page 3 paragraph 0023). The first key creator creates the first part of the key as does the meta-data server and the second key creator creates the second part of the key as does the storage server (page 2 paragraph 0015).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use partial keys created at different servers as in the system of Moskowitz and adding the keys to the data portion of the object in the system of Moore, thus creating a security object. One of ordinary skill in the art would have been motivated to do this because sharing the secret between more devices increases the amount of security since both values are required for decrypting the message.

Moore and Moskowitz do not disclose adding the encrypted block list to the security object.

Brundrett keeps keys in the meta-data (column 4 line 64 to column 5 line 4). The file is encrypted; therefore encrypting a list that identifies the first set of blocks, whereby an encrypted block list is formed (column 15 lines 36-39).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to encrypt the file as in Brundrett and adding the encrypted information to the data portion of the object in the system of Moore. One of ordinary skill in the art would have been motivated to do this because encryption secures the information.

In reference to claim 2, Moore discloses transmitting a file access request and security object from the distributed file system interface to the storage server in response to a file access request from a client application (column 6 lines 36-48), the file access request including an operation code and a reference to selected data of a file (column 19 lines 33-39);

Moore and Moskowitz do not disclose decrypting the block list at the storage server in response to the file access request; providing access to the selected data in accordance with the operation code upon successful decryption of the block list.

Brundrett discloses decrypting the text for the NTFS in response from a request from an application and thereby providing access to the selected data upon successful decryption (column 17 lines 6-34).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to decrypt the file as in Brundrett in the system of Moore. One of ordinary skill in

Art Unit: 2135

the art would have been motivated to do this because decryption makes the encrypted data available to the user.

In reference to claims 3, 8, and 16, Brundrett further discloses encrypting file data at the distributed file interface for file write operations using the encryption key in the security object; and decrypting file data at the distributed file interface for file read operations using the encryption key in the security object (Fig. 17 and Fig. 20).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to encrypt the file as in Brundrett and adding the encrypted information to the data portion of the object in the system of Moore. One of ordinary skill in the art would have been motivated to do this because encryption secures the information.

In reference to claim 9, Moore does not disclose a system generating a partial encryption key at the meta-data server and storing the partial encryption key in the security object; transmitting the security object to the storage server; and completing generation of the encryption key at the storage server using the partial encryption key and storing a complete encryption key in the security object; and returning the security object with the complete encryption key to the meta-data server.

Moskowitz discloses a system wherein the key is created at two different devices (page 2 paragraph 0015 and page 3 paragraph 0023).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to create partial keys as in the system of Moskowitz in the system of Moore. One of ordinary skill in the art would have been motivated to do this because security is increased when more than one person possess the key to sensitive information.

In reference to claim 15, Moore discloses transmitting a file access request and security object from the distributed file system interface to the storage server in response to a file access request from a client application (column 6 lines 36-48), the file access request including an operation code and a reference to selected data of a file (column 19 lines 33-39). Moore discloses locating the copy of the selected resource (Fig. 16 B part 131), which provides the same result as sending the server the object; the server poses the same copy as the client.

Moore and Moskowitz do not disclose decrypting the block list at the storage server in response to the file access request; providing access to the selected data in accordance with the operation code upon successful decryption of the block list.

Brundrett discloses decrypting the text for the NTFS in response from a request from an application and thereby providing access to the selected data upon successful decryption (column 17 lines 6-34).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to decrypt the file as in Brundrett in the system of Moore. One of ordinary skill in the art would have been motivated to do this because decryption makes the encrypted data available to the user.

Allowable Subject Matter

Claims 5-7 and 10-14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Art Unit: 2135

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paula W. Klimach whose telephone number is (571) 272-3854. The examiner can normally be reached on Mon to Thr 9:30 a.m to 5:30 p.m.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Vu can be reached on (571) 272-3859. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
